

#### Scenario:

You are a working mom with a child who was just recently diagnosed with a gluten allergy. To make it easier to keep him on a gluten free diet, you decide to transfer your husband and yourself over to a diet that contains less gluten. However, the store you go to is not very good at telling you which foods are gluten free, so you need something that can help tell you if the food you are buying is gluten free.

Task 1: Set up a full access account and make the app remember what foods you are looking for, and scan your first food.

Task 2: Oops! You don't think that you scanned the right food! Go back and scan again to make sure that you've got the right information.

Task 3: You love the app, but sometimes you forget food you have scanned. Since you have bought the full version, go back in your history and have a look at all of the foods you have and favorite the ones you buy a lot!

#### Notes:

What changes should I make:

1. Add more buttons to not make the user have to go back to the homescreen for every scan.
2. Back buttons and next buttons were not on every screen but were on most of them.
3. Lowering the price on the full version because they were not receiving enough benefits.

What things do I need to keep:

1. Keep the prompt because they aided the user in finding the right screen.
2. The full vs. free accessibility because it seemed helpful to know what entailed both of those.
3. Being able to go back and look at the scan history for people who pay money to receive more benefits.
